

IN THE CLAIMS:

Please cancel Claims 1-19.

Please amend Claim 20 and add new Claims 27-31 as follows:

1.-19 (Cancelled)

20. (Currently Amended) A method for determining the percentage body fat of a four legged domestic pet mammal, comprising the steps of:

measuring a first body dimension having a high correlation with percentage body fat;

measuring a second body dimension having a low correlation with percentage body fat; and

determining the percentage body fat ~~determined~~ from a relationship between only the first and second body measurements and the percentage body fat using a body fat look-up table comprising a first storage area for storing therein entries of the first body dimension, a second storage area storing therein entries of the second body dimension and an output storage area storing an indication of the percentage body fat.

21. (Previously Presented) A method according to claim 20, wherein the first body measurement is the circumference of the ribcage, taken at the 9th rib.

22. (Previously Presented) A method according to claim 20, wherein the second body measurement is a leg index measurement, which is the length of the hind limb measured between the patella (knee) and the calcaneal tuber (hock).

23. (Previously Presented) A method according to claim 20, wherein the output storage area provides an indication of whether the mammal is under, normal or overweight.

24. (Previously Presented) A method according to claim 20, wherein the output storage area provides a numerical percentage body fat.

25. (Previously Presented) A method according to claim 20, wherein the relationship between the percentage body fat and first and second body dimension is given by the equation:

$$PercentageBodyFat = \left[\frac{\left(\frac{R}{C_1} - L \right)}{C_2} \right] - L$$

where R = ribcage circumference

L = leg index measurement

C1 = constant

C2 = constant.

26. (Previously Presented) A method according to claim 20, wherein the four legged mammal is a cat.

27. (New) A method according to claim 20, comprising the further step of determining a target body weight from a relationship between the percentage body fat, a body weight and the target body weight using a look-up table comprising a first storage area for storing entries of the percentage body fat, a second storage area for storing entries of body weight, and an output storage area storing an indication of the target body weight.

28. (New) A method according to claim 27, wherein the relationship between the target weight, the body weight and the percentage body fat is given by the equation:

$$\text{Target weight} = 1.33 \times \text{Body weight (kg)} \times ((100 - \% \text{ body fat})/100).$$

29. (New) A method according to claim 27, wherein the target weight is an ideal weight.

30. (New) A method according to claim 27, further comprising the step of determining an energy allowance.

31. (New) A method according to claim 30, wherein the energy allowance is a daily allowance in kcal/kg.
